ShiftEaze Website

Full Content Export & SEO Handoff

This document compiles every piece of live copy currently published on shifteaze.com: page metadata, headlines, body text, bullet points, calls-to-action, pricing and FAQ. It is organized page by page, in the same order a visitor encounters it, so it can be reviewed and rewritten for SEO without needing to open the codebase.

How to use this document: each page section below lists its SEO title and meta description first, then every headline, subhead, body paragraph, bullet and label in reading order. Edit the wording in place and return the document; nothing here is layout or code, it is text only.

ShiftEaze AI Voice Calling

Tagline

Shift-based manpower management, for any industry that runs in shifts

Default meta description (used site-wide unless a page overrides it)

ShiftEaze auto-builds rosters, predicts no-shows before they cost you a shift, and turns workforce data into decisions. Then it places the calls automatically with ShiftEaze AI Voice Calling. Built for any manpower operation that runs in shifts.

Proof line (used in Hero, Footer, About)

Deployed across major Indian port & terminal operations

3. Problem & Solution

Header

Eyebrow

Filed · the problem

Headline

In shift work, an empty slot is never just an empty slot.

Supporting line

Manual rostering and no-show guesswork don't only slow the back office. They leave expensive machinery and workstations idle, and you only find out once the shift has already started.

Photo caption

Exhibit A, how most operations still plan: spreadsheets, whiteboards and headcount charts that are already out of date.

Three problem cards

Idle capacity cost — *1,000+/hr*

A machine, line or workstation standing idle for a shift burns thousands per hour. A single unfilled slot cascades into the whole day's plan.

When gaps surface — *At shift-start*

With manual rostering, you learn a worker didn't show up the moment the shift begins, too late to arrange cover without scrambling.

How rosters get built — *Spreadsheets*

Cycle after cycle, site by site, planners rebuild DDNNOO rotations by hand: slow to produce and impossible to re-optimize live.

Solution band

Platform view · live

2. Three pillars

Pillar 1 — Auto-rostering

Eyebrow

Auto-rostering

Title

Rosters that build, and rebuild, themselves.

Lead

Building a roster is as easy as dragging and dropping shifts into place. Add or remove an operator in a click, and the whole cycle (even a DDNNOO rotation) rebuilds itself instantly. No other software makes roster-building this simple.

Bullets

- Drag and drop to build any shift cycle, even a DDNNOO rotation
- Add or remove employees in one click
- No spreadsheets. Just the simplest way to build a roster.

“What's different” callout

Most tools generate a roster once. ShiftEaze treats the roster as live: when a prediction or a leave request lands, it re-solves the affected shifts and surfaces the delta, not a fresh blank grid.

Screenshot caption

Scheduler Dashboard · month-long rotation across every operator

Pillar 2 — Attendance prediction

Eyebrow

Attendance prediction

Title

An AI prediction engine that knows who's coming and who's not.

Lead

A trained AI prediction engine studies every operator's attendance pattern and tells you, days before the shift, whether they're likely to show up. No more finding out who's missing at the gate.

Bullets

- Know who's likely to miss a shift, days in advance
- Backed by real math, not a guess
- One-click backfill the moment risk is flagged

“What's different” callout

The score isn't a black-box guess. It's a weighted formula: attendance history, leave proximity, day-of-week pattern and local calendar events each contribute a measurable share of the final risk score, tuned to over-catch risk because a missed no-show costs far more than a standby call.

Screenshot caption

Shift Manager · per-operator prediction, confirmation and final status

Pillar 3 — Workforce analytics

Eyebrow

Workforce analytics

Title

See the live situation, on one screen.

Lead

Open the dashboard and see exactly who's confirmed, who's still coming, and who's pending, for every site, updating in real time. Nothing waits for an end-of-day report.

Bullets

- See who's confirmed, coming, or pending, instantly
- Live, real-time data. Never yesterday's report.
- Spot staffing gaps at a glance

“What's different” callout

Analytics aren't a separate reporting tool bolted on afterwards. Confirmed, coming and pending counts update from the same live stream the predictions run on, so what you plan and what you measure never drift apart.

Screenshot caption

Manpower Summary · strength vs. requirement, live status breakdown

3. How the AI works

Eyebrow

How the AI works

Headline

Purpose-built for shifts: not a generic AI bolted on.

Lead

The prediction that flags a no-show isn't a mystery number from some off-the-shelf model. Deterministic rules decide what's certain; a self-learning scorecard estimates the rest, engineered specifically for shift attendance, and re-trained on each site's own patterns every single week.

Photo caption

It starts on the floor. Every punch-in, leave record and roster change feeds the nightly ingestion the model learns from.

Five pipeline stages

Stage	Title	What happens	Tag
01 · Ingest	Nightly data ingestion	Every night, ShiftEaze pulls each site's attendance history, shift patterns, approved leave and local calendars (festivals and regional events included) into a per-site feature set.	attendance · patterns · leave · calendars
02 · Stage one	Deterministic hard rules	Before any statistics, rule-based overrides run first. Approved leave, notice-period status and known constraints short-circuit the pipeline. These are facts, not probabilities, so they're never left to the model.	rule overrides -> certain outcomes
03 · Stage two	Logistic scorecard model	Everything the rules don't decide flows into a trained logistic scorecard that outputs a calibrated risk probability per operator, recall-weighted on purpose because a missed no-show is far more expensive than a false alarm.	calibrated probability · recall-weighted
04 · Adapt	Weekly retraining	The scorecard retrains weekly on each site's most recent data, so it tracks drift: new crews, seasonal patterns, shifting behaviour, instead of decaying against a stale snapshot.	per-site · drift-aware
05 · Act	Flags & automated action	Risk flags surface directly on the roster where planners already work, and trigger ShiftEaze AI Voice Calling to place priority calls to at-risk operators, all without a dispatcher manually chasing anyone.	roster flags -> automated calls

4. Live dashboards

Eyebrow

Live dashboards

Headline

The whole operation, on one screen.

Lead

Every dashboard reads from the same live stream powering the predictions. See how many have confirmed, how many are coming, and how many are pending, across manpower, shift attendance, trends and leave, per site, as real-time data, not an end-of-day report.

Live stat strip shown under the heading

5,282 confirmed • 621 coming • 311 pending / 6,214 operators · live

Four dashboard tabs

Tab	Title	Description
Manpower	Manpower Summary	Active vs. ideal strength per designation, live status breakdown and grade-quality distribution across every site.
Shift attendance	Shift Attendance	Planned vs. confirmed vs. punched-in, the full confirmation flow, and today's shortfall by site and shift.
Attendance trend	Attendance Summary	Absenteeism trend across months, day-wise attendance, and a designation-level confirmation vs. punch-in split.
Leave	Leave Summary	Applied, approved, pending and rejected leave, rejection follow-up, and balance burn-rate by leave type.

Floating stat callout on the dashboard screenshot

6,000+ Operators tracked live

Photo caption

The operation never stops. Neither does the data. Nightly ingestion keeps every dashboard and every prediction current for the shift that's about to start.

5. See it in motion

Eyebrow

See it in motion

Headline

A minute inside the platform, start to shift-start.

Lead

Watch a roster get built, a no-show flagged, and ShiftEaze AI Voice Calling place the call: the full loop, on real shift data.

6. Page-bottom CTA

Headline

See the platform on your own roster data.

Lead

A 90-day pilot puts auto-rostering and no-show prediction against your real sites before you commit to anything.

AI VOICE CALLING PAGE (/voice-ai)

SEO title

ShiftEaze AI Voice Calling: automated shift & attendance calls

Meta description

ShiftEaze AI Voice Calling places the shift confirmation, punch-in reminder and absence-cover calls automatically, so no operator misses a shift because a phone tree missed them.

Header

Badge

Add-on feature · ShiftEaze AI Voice Calling

Headline

Every call that used to be a phone tree, now automatic.

Subhead

ShiftEaze AI Voice Calling is fully operational the moment you turn it on. It dials operators itself, triggered directly by what's happening on the roster, instead of a dispatcher working the phones. Every call scenario ships ready to go, and every one of them can be customized to match how your operation runs.

Key features (4)

- Calls itself, no dispatcher dialling around
- Speaks the operator's language: English, Hindi or Gujarati
- Fires automatically from platform events, in real time
- Every call scenario is customizable to your operation

Trigger-source side card

Label

Trigger source

Value

Platform events (not a human dispatcher)

Four call scenarios

Trigger	Scenario	What it does
Roster published	Shift confirmation	As soon as a roster is published, operators get a call to confirm the shifts assigned to them, turning silent uncertainty into a confirmed vs. planned number.
Shift change	Punch-in / punch-out reminders	Timed calls remind operators to punch in at the gate and punch out at close, so attendance data reflects who's actually on the floor.
Risk flagged	Absence-priority calls	The moment the model flags an operator as likely absent, ShiftEaze places a priority call. The gap gets worked before the shift, not after it opens.

Trigger	Scenario	What it does
Staff shortfall	Overtime requests	When a shift is short, ShiftEaze calls candidate operators for overtime automatically, backfilling from the right site and grade without a dispatcher dialling around.

Customization note below the four cards

Every scenario above is a starting point: customize the triggers and scripts to fit your own operation.

Photo captions

- The call queue runs itself. Planners watch outcomes instead of dialling.
- Operators confirm in their own language, wherever they are on site.

Data & compliance	Standard	Standard + DPA	India residency, DPA, annual VAPT report
Support	Email, next business day	Priority email + WhatsApp, 8-hour response	Dedicated AM, 99.5% SLA, 4-hour P1

Pricing disclaimer on file (not currently displayed on the live page, kept as source text): “All prices in INR, per active operator, per month. Volume pricing available from 750 operators. Enterprise is scoped to your deployment and billed annually in advance. Implementation fees are charged separately. Figures shown are indicative, replace with final agreed pricing before launch.”

FAQ (shown on the Pricing page)

Eyebrow

FAQ

Headline

Questions, answered.

Lead

Everything ops and procurement usually ask before a pilot. Still unsure? Book a demo and we'll walk your terminals through it.

Q: How is an “operator” defined for billing?

A: An active operator is any frontline worker with a live roster assignment in the billing period. Inactive or archived workers are not billed.

Q: Can we start with one terminal and expand?

A: Yes. The land-and-expand model is designed for exactly this. Most operations start at one terminal, complete a 90-day paid pilot (Rs. 2,50,000, credited in full against the annual contract), then expand site by site.

Q: We already have an HRMS. Does ShiftEaze replace it?

A: No. ShiftEaze owns the shift (rostering, gate attendance, prediction and backfill) and exports to your HRMS rather than replacing it. The question worth asking is what your HRMS tells you three days before a night shift.

Q: What about operators who don't use smartphones?

A: That is precisely why ShiftEaze Voice exists. Five autonomous calling scenarios in English, Hindi and Gujarati reach any operator by phone, and every outcome is HMAC-verified and logged.

Q: Is Aadhaar data stored?

A: No. RGID is derived from a limited digit set combined with date of birth: an internal identifier, not a copy of any Aadhaar data. All data is India-resident and covered by a DPA, with an annual VAPT report on Enterprise.

Q: What does the 90-day paid pilot involve?

A: One terminal, 300–800 operators, full production use rather than a sandbox. The Rs. 2,50,000 pilot fee is credited in full against the first annual contract, and written success criteria are agreed before day one.

ABOUT PAGE (/about)

SEO title

About

Meta description

Shift-based manpower management, for any industry that runs in shifts. Deployed across major Indian port & terminal operations.

Header

Eyebrow

Filed · company record

Headline

Built for the people who cover a shift no one saw coming.

Paragraph 1

ShiftEaze exists because manpower-driven work runs on people, and people are the hardest part of the plan to get right. Wherever an operation runs in shifts (ports and terminals, factories, warehouses, facilities and security teams, staffing agencies), ShiftEaze turns rostering, attendance and analytics into one live system instead of three disconnected ones.

Paragraph 2

Deployed across major Indian port & terminal operations, and built from day one to run anywhere shift-based manpower is managed.

Scale stats

- 6,000+ — Operators managed live
- 12+ — Sites & divisions

APPENDIX: NOTES FOR THE WRITER

Voice & style notes to preserve

- Plain language over jargon — recent edits deliberately replaced internal system-event names (e.g. “Shift boundary”) with plain phrases (“Shift change”).
- Short, crisp bullets — aim for a single clause, not a full sentence, where the layout shows a bullet list.
- Minimal em dashes — the team has been actively removing em dashes site-wide in favor of periods, colons and commas so copy doesn't read as AI-generated. Please keep that pattern.
- “Site” over “terminal” in general copy — the brand recently broadened from port-only language to general shift-based manpower management. “Terminal” and “port” are still accurate and used deliberately in proof points (they're real, factual deployments), but general product copy now says “site” so it reads for any industry.
- ShiftEaze AI Voice Calling is a “feature,” not a “module” in customer-facing copy.

Known placeholders

- Trust-bar / About-page industry chips are illustrative category names, not real client logos or names — real client logos can replace them once cleared for use.
- All rupee figures on the Pricing page are the current working figures; confirm with the commercial team before publishing.
